

## **Module End Assignment:**

### **“Analyzing E-Learning Platform Purchases using MySQL”**

#### **Descriptive Analysis**

- Total purchases and revenue are unevenly distributed across learners and courses.
- A few courses account for most enrollments.
- Certain categories generate higher revenue due to higher prices, not higher volumes.
- Some learners have purchased from multiple categories, showing broader engagement.
- A few courses have no purchases at all.

#### **Diagnostic Analysis**

- High revenue from specific courses is high.
- Learners purchasing across categories are Career-focused on Upskilling.
- Country-wise spending differences may be caused by regional demand for certain skills.

#### **Predictive Analysis**

- Popular courses will continue to dominate enrollments unless new alternatives are introduced.
- Learners who have already purchased multiple courses are more likely to buy again and spend higher amounts in the future.
- Categories with high revenue, but fewer learners may grow slower in volume but remain profitable.

## Prescriptive Analysis

- Focus on marketing campaigns on top-performing courses.
- Offer course bundles for learners buying across categories.
- Apply dynamic pricing or discounts for low-performing courses.
- Improve, rebrand, or discontinue courses with zero enrollments.
- Use country-specific offers to maximize regional revenue.
- Introduce loyalty programs for repeat learners.

## Conclusion

The analysis shows that revenue is driven by a small group of high-performing courses and highly engaged learners. Strategic focus on top categories, cross-category learners, and optimization of underperforming courses can significantly improve revenue and learner retention. Data-driven decisions will enable sustainable growth for the e-learning platform.
